“Marine 3D Seismic Surveys – Towed Streamer Survey Design and Data Acquisition”

BY

**Philip Fontana, Geophysical Manager
Veritas Marine Acquisition
Houston TX**

When: Friday, January 27, 2006, 4PM

Where: 4412 Spicewood Springs Rd Bldg 800, Mid Level

Host: Nathan Bangs, UTIG

During the past 20 years 3D seismic surveys have become a critical component in the discovery and exploitation of commercial oil and gas deposits. Offshore, the majority of 3D surveys are acquired using the towed streamer method of data acquisition. This presentation will provide an overview of the basic temporal and spatial sampling considerations that form the basis of a towed streamer 3D survey design. That information will then be used to demonstrate how modern marine 3D seismic vessels integrate state-of-the-art seismic source systems, receiver/recording systems, and navigation and positioning systems to meet the 3D imaging objectives.
